Outline

- 1 Introduction
- 2 Detection of ASCII traffic
- 3 Selective capping sniffer architecture
- 4 Results and discussion
- 5 Conclusions
- 6 Future Work

Outline

- 1 Introduction
- 2 Detection of ASCII traffic
- 3 Selective capping sniffer architecture
- 4 Results and discussion
- 5 Conclusions
- 6 Future Work

Introduction

- Traffic capture and storage at multi-Gb/s rates is a demanding task:
 - Capture throughput
 - Write throughput
 - Storage capacity
- Huge amount of useless packet payloads (encrypted traffic)
- A packet is only interesting for storage if it can be interpreted by network analysts:
 - Unknown binary protocols cannot be interpreted
 - Text-based or well-known binary protocols can be interpreted

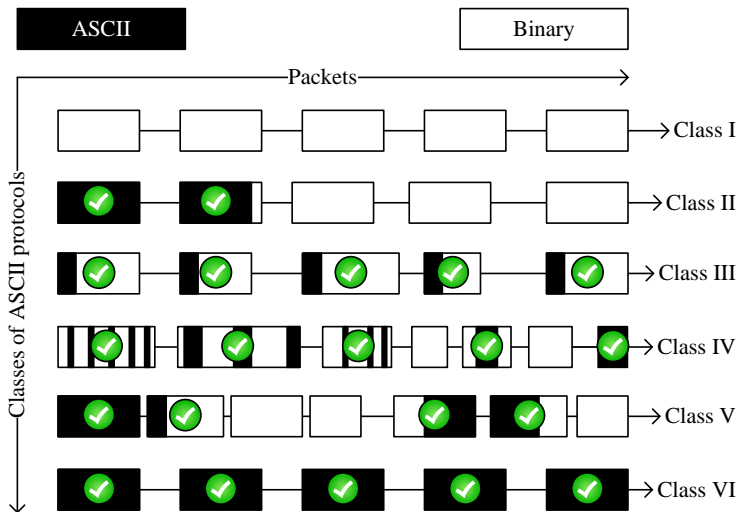

Introduction

Objectives

- 1 Cap packets to reduce the storage capacity needed:
 - Cap unknown binary protocols
 - Keep text-based and well-known binary protocols
- 2 Detect packets containing ASCII bytes as representative of human readable characters
- 3 Identify and categorize protocols based on ASCII distribution
- 4 Implement capping method in a high-performance driver

Introduction

Packet Taxonomy

Outline

- 1 Introduction
- 2 Detection of ASCII traffic**
- 3 Selective capping sniffer architecture
- 4 Results and discussion
- 5 Conclusions
- 6 Future Work

Detection of ASCII traffic

Runs threshold

- Detect ASCII character runs of specific length
- Run-length must be large enough to reduce the error (FP) with respect to a random uniform payload distribution
- The probability of generating a random byte-value contained in the ASCII range is 0.4
- Error can be modeled using a Markov chain with $L+1$ states, each of it corresponding to have read an ASCII run of L consecutive characters

Detection of ASCII traffic

Runs threshold

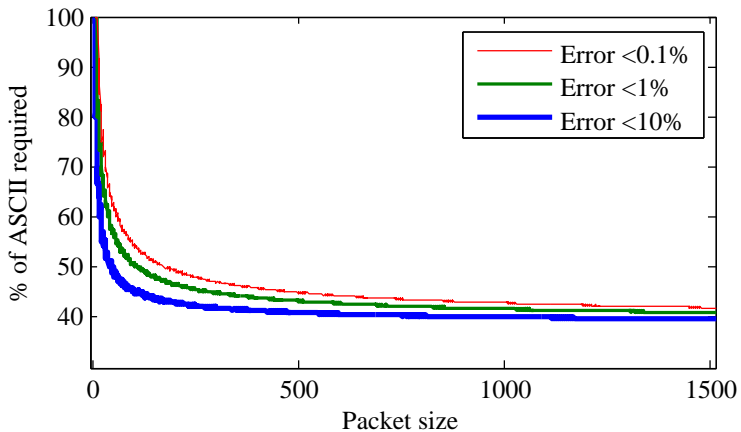

Detection of ASCII traffic

Percentage threshold

- TLV-based protocols contain ASCII characters but is not likely to find long ASCII runs
- A packet is a sequence of N bytes each with probability p of being ASCII and probability $1-p$ of being a non-ASCII value
- Use binomial distribution to calculate the minimum ASCII percentage required for an error threshold

Detection of ASCII traffic

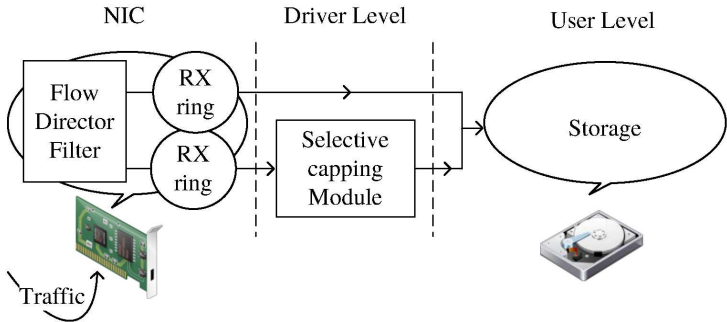

Percentage threshold

Outline

- 1 Introduction
- 2 Detection of ASCII traffic
- 3 Selective capping sniffer architecture**
- 4 Results and discussion
- 5 Conclusions
- 6 Future Work

Selective capping sniffer architecture

Outline

- 1 Introduction
- 2 Detection of ASCII traffic
- 3 Selective capping sniffer architecture
- 4 Results and discussion**
- 5 Conclusions
- 6 Future Work

Results and discussion

Testbed

- The ASCII-capping module has been implemented over a high-performance network driver (HPCAP)
- Use of commodity server equipped with Intel 10 Gb/s card and RAID-0 storage
- Traffic traces replayed with FPGA
- Performance and compression ratio are evaluated when lossless capture and storage is achieved

Trace	Capture Point	Info.
1	University	DNS , HTTP , SSH Dropbox , Others
2	HTTP proxy	HTTP
3	Bank network	HTTP, HTTPS, SSH Banking protocols, DNS

Results and discussion

Compression Ratio

Trace	Compression ratio	% of capped packets
1	4.28	45
2	3.33	74
3	3.24	81

Results and discussion

Performance Evaluation

Trace	Avg. throughput (Gb/s)	Avg. packet rate (Kpps)
	\pm Std. Dev.	\pm Std. Dev.
1	3.1 ± 0.13	2221 ± 100
2	2.5 ± 0.08	856 ± 29
3	3.2 ± 0.15	428 ± 21

Outline

- 1 Introduction
- 2 Detection of ASCII traffic
- 3 Selective capping sniffer architecture
- 4 Results and discussion
- 5 **Conclusions**
- 6 Future Work

Conclusions

- A solution for on-the-fly packet capping in multi-Gb/s networks has been presented
- Capping is performed identifying ASCII packets based on two different methods
- A taxonomy of protocols based on the amount and distribution of ASCII characters has been presented
- Implementation over a high-performance capture engine (HPCAP):
 - Performance between 2.5 and 3.2 Gb/s
 - Compression ratio between 3 and 4

Outline

- 1 Introduction
- 2 Detection of ASCII traffic
- 3 Selective capping sniffer architecture
- 4 Results and discussion
- 5 Conclusions
- 6 Future Work**

Future Work

- 1 Increase performance to cope with fully-loaded 10 Gb/s links:
 - Use of parallelism paradigms (multi-core programming and GPUs)
 - Use of sampling strategies for ASCII inspecting
 - Use of hardware solutions (NetFPGA)
- 2 Identify useless ASCII payload using dispersion measurements
- 3 Detect other codification schemes (UTF-8 and base64)

Thank you for your attention!
